# X20(c)AT4222

# 1 General information

The module is equipped with 4 inputs for PT100/PT1000 resistance temperature measurement.

- · 4 inputs for resistance temperature measurement
- For PT100 and PT1000
- · Configurable sensor type per channel
- · Direct resistance measurement
- · Configurable 2- or 3- wire connections per module
- · Configurable filter time

### 2 Coated modules

Coated modules are X20 modules with a protective coating for the electronics component. This coating protects X20c modules from condensation and corrosive gases.

The modules' electronics are fully compatible with the corresponding X20 modules.

For simplification purposes, only images and module IDs of uncoated modules are used in this data sheet.

The coating has been certified according to the following standards:

- Condensation: BMW GS 95011-4, 2x 1 cycle
- Corrosive gas: EN 60068-2-60, method 4, exposure 21 days

## 2.1 -40°C starting temperature

The starting temperature describes the minimum permissible ambient temperature when the power is switched off at the time the coated module is switched on. This is permitted to be as low as -40°C. During operation, the conditions as specified in the technical data continue to apply.

#### Information:

It is important to absolutely ensure that there is no forced cooling by air currents in a closed control cabinet, for example using a fan or ventilation slots.

# 3 Order data

Model number	Short description
	Temperature measurement
X20AT4222	X20 temperature input module, 4 inputs for resistance measure- ment, PT100, PT1000, resolution 0.1°C, 3-wire connections
X20cAT4222	X20 temperature input module, coated, 4 inputs for resistance measurement, PT100, PT1000, resolution 0.1°C, 3-wire connections
	Required accessories
	Bus modules
X20BM11	X20 bus module, 24 VDC keyed, internal I/O supply continuous
X20BM15	X20 bus module, with node number switch, 24 VDC keyed, internal I/O supply continuous
X20cBM11	X20 bus module, coated, 24 VDC keyed, internal I/O supply continuous
	Terminal blocks
X20TB12	X20 terminal block, 12-pin, 24 VDC keyed

- Based on the current resistance value.

  Based on the entire resistance measurement range.

# **5 LED status indicators**

For a description of the various operating modes, see section "Additional information - Diagnostic LEDs" of the X20 system user's manual.

Figure	LED	Color	Status	Description
	r	Green	Off	No power to module
			Single flash	RESET mode
			Blinking	PREOPERATIONAL mode
			On	RUN mode
2	e e	1	Off	No power to module or everything OK
24 3 4			On	Error or reset status
<b>5 6</b>			Single flash	Warning/Error on an I/O channel. Overflow or underflow of the analog inputs.
õ	e + r	Red on / Greer	single flash	Invalid firmware
X20	1 - 4	Green	Off	The input is switched off
Blinking Overflow, u		Overflow, underflow or open line		
			On	Analog/digital converter running, value OK

# **6 Pinout**

Channels that are not being used should be disabled.

# 8 Input circuit diagram

# 2-wire connections

#### 3-wire connections

# 9 Register description

## 9.1 General data points

In addition to the registers described in the register description, the module has additional general data points. These are not module-specific but contain general information such as serial number and hardware variant.

General data points are described in section "Additional information - General data points" of the X20 system user's manual.

# 9.2 Function model 0 - "3-wire connections" and function model 1 - "2-wire connections"

With this module, the type of connection is selected using function models 0 and 1.

Function model	Connection type
0	3-wire connections (standard)
1	2-wire connections

The registers applied are identical for both function models:

Register	Name	Data type	Read		Write	
			Cyclic	Acyclic	Cyclic	Acyclic
Configuratio	n	· · · · · · · · · · · · · · · · · · ·				
16	ConfigOutput01 (input filter)	USINT				•
18	ConfigOutput02 (sensor configuration)	UINT				•
Communicat	ion					
0	Temperature01	INT	•			
	Resistor01	UINT				
2	Temperature02	INT	•			
	Resistor02	UINT				
4	Temperature03	INT	•			
	Resistor03	UINT				
6	Temperature04	INT	•			
	Resistor04	UINT				
28	IOCycleCounter	USINT	•			
30	StatusInput01	USINT	•			

## 9.3 Function model 254 - Bus controller

Register	Offset1)	Name	Data type	Read		W	rite
				Cyclic	Acyclic	Cyclic	Acyclic
Configuration							
16	-	ConfigOutput01 (input filter)	USINT				•
18	-	ConfigOutput02 (sensor configuration)	UINT				•
Communication	n						
0	0	Temperature01	INT	•			
	0	Resistor01	UINT				
2	2	Temperature02	INT	•			
	2	Resistor02	UINT				
4	4	Temperature03	INT	•			
	4	Resistor03	UINT				
6	6	Temperature04	INT	•			
	6	Resistor04	UINT				
28	-	IOCycleCounter	USINT		•		
30	-	StatusInput01	USINT		•		

<sup>1)</sup> The offset specifies the position of the register within the CAN object.

#### 9.3.1 Using the module on the bus controller

Function model 254 "Bus controller" is used by default only by non-configurable bus controllers. All other bus controllers can use other registers and functions depending on the fieldbus used.

For detailed information, see section "Additional information - Using I/O modules on the bus controller" of the X20 user's manual (version 3.50 or later).

#### 9.3.2 CAN I/O bus controller

The module occupies 1 analog logical slot on CAN I/O.

#### 9.4 General information

### 9.4.1 Analog inputs

The module outputs the converted analog values to the registers. Other ranges of values or data types result depending on resistance or temperature measurement.

## Information:

Operating channels outside specifications can affect neighboring channels.

#### **9.4.2 Timing**

The timing for acquiring measured values is controlled by the converter hardware. All switched-on inputs are converted during each conversion cycle and transferred halfway through the X2X Link cycle.

#### 9.4.3 Conversion time

The conversion time for the channels depends on their use. For the formulas listed in the table, "n" corresponds to the number of channels that are switched on.

Use of the channels	Conversion time
1 channel	1 · Filter time
n channels with the same sensor type	n · (20 ms + Filter time)
n channels with different sensor types	n · (20 ms + 2 · Filter time)

#### 9.4.4 Reduced update time

Any inputs that are not needed can be switched off, which reduces the I/O update time. Inputs can also be only switched off temporarily.

#### Calculating the time saved

The amount of time saved can be calculated with the following formula. And "n" corresponds to the number of inputs that are switched off.

Time saved =  $n \cdot (20 \text{ ms} + \text{filter time})$ 

#### **Examples**

Inputs are filtered using a 60 Hz filter.

	Example 1	Example 2	Example 3
Switched on inputs	1	1 and 3	1 to 4
Conversion time	16.7 ms	73.4 ms	146.8 ms

# 9.5 Configuration

### 9.5.1 Input filter

Name:

ConfigOutput01

The filter time of all analog inputs is defined in this register.

Data type	Value	Filter	Filter time
USINT	0	15 Hz	66.7 ms
	1	25 Hz	40 ms
2		30 Hz	33.3 ms
	3	50 Hz (bus controller default setting)	20 ms
	4	60 Hz	16.7 ms
	5	100 Hz	10 ms
	6	500 Hz	2 ms
	7	1000 Hz	1 ms

### 9.5.2 Sensor configuration

Name:

ConfigOutput02

The sensor type of the individual channels is configured in this register.

This module is designed for temperature and resistance measurement. Due to different adjustment values for temperature and resistance, the sensor type must be selected.

By default, all channels are switched on. To save time, individual channels can be switched off (see "Reduced update time" on page 7).

Data type	Values	Bus controller default setting
UINT	See the bit structure.	8738

#### Bit structure:

Bit	Description	Value	Information
0 - 3	Channel 1	0000 - 0001	Reserved
		0010	Sensor type PT100 (bus controller default setting)
		0011	PT1000 sensor type
		0100	Reserved (channel switched off)
		0101	Resistance measurement 0.1 to 4500 Ω
		0110	Resistance measurement 0.05 to 2250 Ω
		0111	Channel switched off
		1000 - 1111	Reserved
12 - 15	Channel 4	0000 - 0001	Reserved
		0010	Sensor type PT100 (bus controller default setting)
		0011	PT1000 sensor type
		0100	Reserved (channel switched off)
		0101	Resistance measurement 0.1 to 4500 Ω
		0110	Resistance measurement 0.05 to 2250 Ω
		0111	Channel switched off
		1000 - 1111	Reserved

#### 9.6 Communication

### 9.6.1 Input values of analog inputs

Name:

Temperature01 to Temperature04

Resistor01 to Resistor04

This register contains the analog input values depending on the configured operating mode.

Data type	Digital value	Input signal
INT	-2000 to 8500 (for -200.0 to 850.0°C)	PT100 sensor type
	-2000 to 8500 (for -200.0 to 850.0°C)	PT1000 sensor type
UINT	1 to 45000 (resolution 0.1 $\Omega$ ) Resistance measurement 0.1 to 4500 $\Omega$	
	1 to 45000 (resolution 0.05 Ω)	Resistance measurement 0.05 to 2250 Ω

In order for the user to always be supplied with a defined output value, the following must be taken into consideration:

- Up to the first conversion, 0x8000 is output.
- · After switching the operating mode until the first conversion:
  - ° From "Resistance measurement" to "Sensor type PTxx": 0x8000
  - ° From "Sensor type PTxx" to "Resistance measurement": 0xFFFF
- If the input is not switched on, 0x8000 is output.

#### 9.6.2 I/O cycle counter

Name:

**IOCycleCounter** 

The cyclic counter increases after all input data has been updated.

Data type	Values	Information
USINT	0 to 255	Repeating counter

# 9.6.3 Status of the inputs

Name:

StatusInput01

The module's inputs are monitored. A change in the monitoring status is actively transmitted as an error message.

Data type	Values
USINT	See the bit structure.

#### Bit structure:

Bit	Description	Value	Information
0 - 1	Channel 1	00	No error
		01	Lower limit value undershot
		10	Upper limit value overshot
		11	Open circuit
6 - 7	Channel 4	00	No error
		01	Lower limit value undershot
		10	Upper limit value overshot
		11	Open circuit

### Limiting the analog value

In addition to the status information, the analog value is fixed to the values listed below by default in an error state.

Error state	Temperature measurement Digital value on error	Resistance measurement Digital value on error
Open circuit	32767 (0x7FFF)	65535 (0xFFFF)
Upper limit value overshot	32767 (0x7FFF)	65535 (0xFFFF)
Lower limit value undershot	-32767 (0x8001)	0 (0x0000)
Invalid value	-32768 (0x8000) <sup>1)</sup>	65535 (0xFFFF)
	32767 (0x7FFF) <sup>2)</sup>	
	65535 (0xFFFF) <sup>3)</sup>	

- 1) Default value or channel was disabled in the I/O configuration.
- 2) After switching off the channel during operation.
- 3) Value in function model 254 Bus controller.

# 9.7 Minimum cycle time

The minimum cycle time specifies the time up to which the bus cycle can be reduced without communication errors occurring. It is important to note that very fast cycles reduce the idle time available for handling monitoring, diagnostics and acyclic commands.

Minimum cycle time
100 µs

# 9.8 Minimum I/O update time

The minimum I/O update time specifies how far the bus cycle can be reduced so that an I/O update is performed in each cycle.

Minimum I/O update time	
1 input	Equal to the filter time
n inputs	n · (20 ms + filter time)
